

EFFICIENCY. SOLAR. SURFACES.

Alanod-Solar

EFFICIENCY, SOLAR, SURFACES,

Surface treatment par excellence

As a wholly own subsidiary of ALANOD®, Alanod-Solar® benefits from more than 30 years of experience in the production of surface finished aluminium and copper strips. This expertise enables Alanod-Solar to focus with its products on the environmentally friendly generation of solar energy.

On four vacuum coating lines (PVD), and a lacquering line, special developed for Sol-Gel processes, selective absorbing or highly reflective coating systems are produced in an coilto-coil process. An existing global sales network ensures tailor-made, on-site advice and support.

Whichever world wide market you are in, we have on hand the resources and logistics to look after your specific needs.

Solar absorption

sunselect®, mirotherm® and mirosol® are the three selective absorber coating systems for solar collectors. Those coatings are continuously produced in a PVD-process. This achieves 95% absorption and at the same time, a low emission of not more than 5%. For the first time

we offer, with mirosol TS, a coil coated selective absorptive lacquer.

All the absorbing products are used in a diverse range of solar-thermal collectors. Mostly copper or aluminium tubes are welded to the rear side of the absorbers to conduct heat, whereby laser welding has become established as the optimum technology for joining together both identical and dissimilar metals. This method ensures that the joints achieve not only long-term mechanical stability but also excellent thermal conductivity.

Solar reflection

With our reflecting surfaces, we offer various materials with a total solar reflectance ranging between 85% and 95%. Thanks to a weather-resistant nano-composite layer, MIRO-SUN® is an ideal material for outdoor applications. This is used in CPC reflectors (CPC= Compound Parabolic Concentrator), evacuated tube collectors and parabolic trough concentrators (CSP = Concentrated Solar Power). In addition, MIRO-SUN® can also be used as a concentrating reflector material for photovoltaic applications (CPV = Concentrated Photovoltaics).

The nine different products in the portfolio enables Alanod-Solar to offer an ideal component for every possible application.

Global player

Our top quality products are now sold, processed and installed by our partner companies on all five continents. We are the world's first company to have reached the milestone of having sold more than 14 million square metres of absorber surface area.

Furthermore, we have an integrated and certified quality and environmental management system according to DIN EN ISO 9001: 2000 and 14001: 2005.

Product advantages

EFFICIENCY. SOLAR. SURFACES.

Applications:

- flat plate collectors
- air collectors
- vacuum tube collectors

Absorption:

- 10 year material warranty
- selective coatings system ensures maximum absorption and lowest emission
- all standard joining technologies can be used
- protective film or paper interleaving available upon request
- CO₂ savings per sqm:
 100 kg/year compared to natural gas
 130 kg/year compared to heating oil
- > 14 Mio sqm supplied and installed worldwide
- more than 1.4 Mio tons CO₂ savings annually
- state-of-the-art continual in-line measurement processes guarantee maximum quality standards
- environmentally friendly/emission-free manufacturing process
- low energy balance

Applications:

- evacuated tube collectors (CPC Compound Parabolic Concentrator)
- parabolic trough power plants (CSP Concentrated Solar Power)
- micro parabolic trough (CST Concentrated Solar Thermal)
- photovoltaics (CPV Concentrated Photovoltaics)
- solar cookers
- heliostats

Reflection:

- 10 year material warranty
- weather resistant thanks to nanocomposite layer
- optimized for highest solar reflection
- UV resistant
- heat resistant
- easy to clean
- formable
- flexible
- scratchproof
- no delamination
- environmentally friendly/emission free manufacturing process
- low energy balance

Absorption

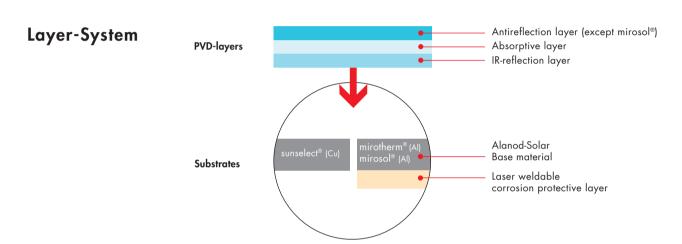

Technical information

sunselect®, mirotherm® and mirosol®

Consists of an aluminium- or copperstrip which has been anodised on both sides; then in a world-wide unique air-to-air process, a system of three layers is applied using the physical vapour deposition technique (PVD). While an infrared reflecting layer ensures low thermal emission (ϵ), the metal oxide absorption- and antireflection layers ensure highest solar absorption (α) while offering resistance against outside agents.

mirosol® TS

For the first time, besides PVD coatings, selective lacquer is available for solar thermal applications. mirosol TS is a selective lacquer applied in a special developed process on aluminium. The selective lacquer is hydrophob and resistant to fingerprints.

Reflection

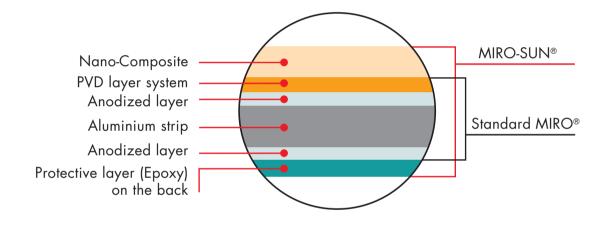

Technical information

MIRO-SUN®

Based on our MIRO®-product range which produces approx. 95% total light reflection we have developed MIRO-SUN® especially for outdoor-applications. A continuous air-to-air PVD-process applies a super-

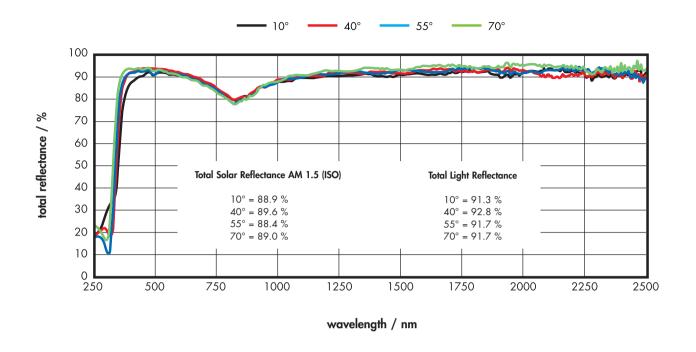

reflective layer (MIRO®) to coil anodized material and afterwards (MIRO-SUN®) is protected by a Nano-Composite in a coil-coating process.

Layer System
